VITAL HEALTH AND FAMILY PLANNING

Women's health is immensely important because it affects the health of the next generation. Today's concern on women's health revolves on the right of women to have their health needs addressed as women and not merely for their roles as mothers. Thus, reproductive health was introduced as an aid to address said issue.

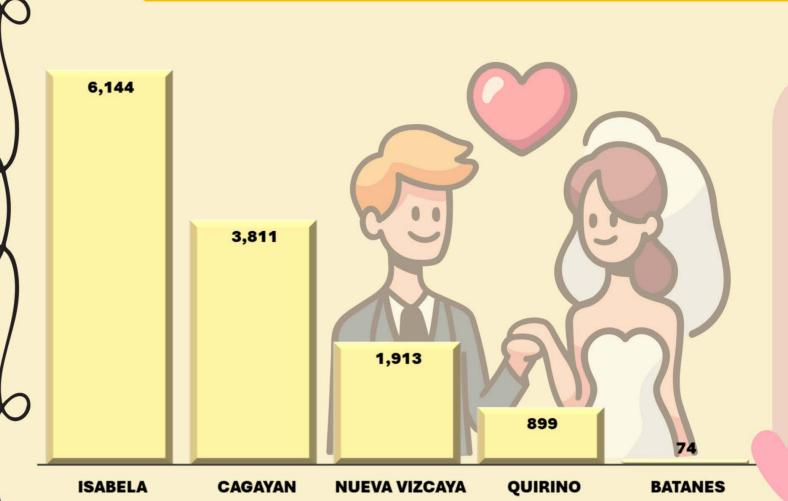

Good health status among women is manifested by their longer life expectancies and much reduced mortality rates during childhood and adulthood compared to men who are more prone to accidents because of their exposure to the working environment.
